Package 'Glimma'

October 12, 2021

```
Title Interactive HTML graphics
Version 2.2.0
Description This package generates interactive visualisations for analysis of RNA-sequencing data us-
     ing output from limma, edgeR or DESeq2 packages in an HTML page. The interac-
     tions are built on top of the popular static representations of analysis results in order to pro-
     vide additional information.
Encoding UTF-8
RoxygenNote 7.1.1
biocViews DifferentialExpression, GeneExpression, Microarray,
     ReportWriting, RNASeq, Sequencing, Visualization
Depends R (>= 4.0.0)
Imports htmlwidgets, edgeR, DESeq2, limma, SummarizedExperiment,
     stats, isonlite, methods, S4Vectors
Suggests testthat, knitr, rmarkdown, BiocStyle, IRanges,
     GenomicRanges, pryr

```

as.hexcol

Numeric to hex colour converter

Description

Convert numbers and R colour strings into corresponding hex codes for colours

Usage

```
as.hexcol(x)
```

Arguments

Х

the colour value(s) to be converted to hex values.

Value

hex codes for colours

Examples

```
as.hexcol(c(1, 2, 3))
as.hexcol(c("red", "black", "green"))
```

4 glimmaMA

glimma

Glimma: interactive graphics from limma

Description

The Glimma package provides iteractive versions of plots frequently used in the limma package. Currently the MDS and MD plots have been implemented. The functions can be used with both limma, edgeR and DESeq objecs.

Main functions

```
glMDSPlot, glMDPlot, glXYPlot
```

glimmaMA

Glimma MA Plot

Description

Generic function for drawing a two-panel interactive MA plot, a special case of the glimmaXY plot. The function invokes the following methods which depend on the class of the first argument:

- glimmaMA.MArrayLM for limma analysis
- glimmaMA.DGEExact for edgeR analysis, produced from exactTest
- glimmaMA. DGELRT for edgeR analysis, produced from glmLRT
- glimmaMA.DESeqDataSet for DESeq2 analysis

Usage

```
glimmaMA(x, ...)
```

Arguments

- x the DE object to plot.
- ... additional arguments affecting the plots produced. See specific methods for detailed arguments.

Details

The summary plot on the left represents gene-wise log-fold-change (logFC) on the y-axis versus average gene expression calculated as log-counts-per-million (logCPM) values. We call our summary plot an MA plot because this type of plot was originally referred to as an MA plot in the limma package, with the M-value representing logFC and A-value representing average expression - it has since been renamed to MD plot in the limma package. The expression plot on the right displays sample expression values for a single gene. Interactions with the htmlwidget include clicking on

genes (points) in the summary plot to bring up associated sample expression values in the expression plot, as well as the summary statistics in the table below. Alternatively, users can interact with the table by clicking on genes (rows) to highlight genes in the summary plot, as well as bring up associated sample expression values in the expression plot. Briefly, other interactive features include a search box for the table, buttons to save plots and data (summary statistics and expression values), additional pop-up information when hovering on points in plots, and rescaling of the y-axis in the expression plot.

Value

htmlwidget object or NULL if html argument is specified.

Examples

```
methods(glimmaMA) # show methods for glimmaMA
```

```
glimmaMA.DESeqDataSet Glimma MA Plot
```

Description

Draws a two-panel interactive MA plot from an DESeqDataSet object. This is a special case of the glimmaXY plot.

Usage

```
## S3 method for class 'DESegDataSet'
glimmaMA(
  х,
  counts = DESeq2::counts(x),
 groups = extractGroups(colData(x)),
 status = NULL,
  anno = NULL,
 display.columns = NULL,
  status.cols = c("dodgerblue", "silver", "firebrick"),
  sample.cols = NULL,
  transform.counts = c("logcpm", "cpm", "rpkm", "none"),
 main = "MA Plot",
 xlab = "logCPM",
 ylab = "logFC",
 html = NULL,
 width = 920.
 height = 920,
)
```

Arguments

x DESeqDataSet object from which summary statistics are extracted from to create summary (left) plot.

counts numeric matrix with nrow(x) rows containing gene expression values.

groups vector/factor representing the experimental group for each sample; see extractGroups

for default value.

status vector of length nrow(x) indicating the status of each gene.

anno dataframe with nrow(x) rows containing gene annotations.

display.columns

character vector containing names of columns from anno from which to display

in mouseover tooltips and table.

status.cols vector of length 3 containing valid CSS strings for colours associated with status

in the order of -1, 0 and 1.

sample.cols character vector of length ncol(counts) containing valid CSS strings for colours

associated with each sample to be displayed on the expression plot. If left un-

specified, samples will be coloured according to groups.

transform.counts

the type of transform used on the counts log-cpm by default. edgeR::cpm(counts,log=TRUE);

defaults to FALSE.

main character string for the main title of summary plot.

xlab character string for the x-axis label of summary plot.

ylab character string for the y-axis label of summary plot.

html character string for naming HTML file for exportation of widget. The extension

should be included in the file name e.g. "file.html".

width numeric value indicating width of widget in pixels.
height numeric value indicating width of height in pixels.

... addition unused arguments.

Details

The summary plot on the left represents gene-wise log-fold-change (logFC) on the y-axis versus average gene expression calculated as log-counts-per-million (logCPM) values. We call our summary plot an MA plot because this type of plot was originally referred to as an MA plot in the limma package, with the M-value representing logFC and A-value representing average expression - it has since been renamed to MD plot in the limma package. The expression plot on the right displays sample expression values for a single gene. Interactions with the htmlwidget include clicking on genes (points) in the summary plot to bring up associated sample expression values in the expression plot, as well as the summary statistics in the table below. Alternatively, users can interact with the table by clicking on genes (rows) to highlight genes in the summary plot, as well as bring up associated sample expression values in the expression plot. Briefly, other interactive features include a search box for the table, buttons to save plots and data (summary statistics and expression values), additional pop-up information when hovering on points in plots, and rescaling of the y-axis in the expression plot.

glimmaMA.DGEExact

7

Value

htmlwidget object or NULL if html argument is specified.

See Also

```
glimmaMA, glimmaMA.MArrayLM, glimmaMA.DGEExact, glimmaMA.DGELRT
```

Examples

```
dge <- readRDS(
   system.file("RNAseq123/dge.rds", package = "Glimma"))

dds <- DESeq2::DESeqDataSetFromMatrix(
   countData = dge$counts,
   colData = dge$samples,
   rowData = dge$senes,
   design = ~group
)

dds <- DESeq2::DESeq(dds, quiet=TRUE)
glimmaMA(dds)</pre>
```

glimmaMA.DGEExact

Glimma MA Plot

Description

Draws a two-panel interactive MA plot from an DGEExact object. This is a special case of the glimmaXY plot.

Usage

```
## S3 method for class 'DGEExact'
glimmaMA(
    x,
    dge = NULL,
    counts = dge$counts,
    groups = dge$samples$group,
    status = edgeR::decideTestsDGE(x),
    anno = x$genes,
    display.columns = NULL,
    status.cols = c("dodgerblue", "silver", "firebrick"),
    sample.cols = NULL,
    p.adj.method = "BH",
    transform.counts = c("logcpm", "cpm", "rpkm", "none"),
    main = paste(x$comparison[2], "vs", x$comparison[1]),
    xlab = "logCPM",
```

```
ylab = "logFC",
html = NULL,
width = 920,
height = 920,
...
)
```

Arguments

x DGEExact object from which summary statistics are extracted from to create summary (left) plot.

dge DGEList object with nrow(x) rows from which expression values are extracted

from to create expression (right) plot. Gene counts are taken from dge\$counts

and sample groups from dge\$samples\$group.

counts numeric matrix with nrow(x) rows containing gene expression values. This can

be used to replace raw gene counts from dge\$counts with transformed counts

e.g. logCPM or logRPKM values.

groups vector of length ncol(dge) representing categorisation of samples in expression

plot.

status vector of length nrow(x) indicating the status of each gene. By default genes in

the summary plot are coloured based on its differential expression status using an adjusted p-value cutoff of 0.05 by calling the edgeR::decideTestsDGE() function, where the value of -1 marks down-regulated genes, 0 marks genes

with no expression difference, and 1 marks up-regulated genes.

anno dataframe with nrow(x) rows containing gene annotations.

display.columns

character vector containing names of columns from anno from which to display

in mouseover tooltips and table.

status.cols vector of length 3 containing valid CSS strings for colours associated with status

in the order of -1, 0 and 1.

sample.cols character vector of length ncol(counts) containing valid CSS strings for colours

associated with each sample to be displayed on the expression plot. If left un-

specified, samples will be coloured according to groups.

p.adj.method character string specifying p-value adjustment method.

transform.counts

the type of transform used on the counts log-cpm by default. edgeR::cpm(counts,log=TRUE);

defaults to FALSE.

main character string for the main title of summary plot.

xlab character string for the x-axis label of summary plot.

ylab character string for the y-axis label of summary plot.

html character string for naming HTML file for exportation of widget. The extension

should be included in the file name e.g. "file.html".

width numeric value indicating width of widget in pixels. height numeric value indicating width of height in pixels.

. . . addition unused arguments.

glimmaMA.DGELRT 9

Details

The summary plot on the left represents gene-wise log-fold-change (logFC) on the y-axis versus average gene expression calculated as log-counts-per-million (logCPM) values. We call our summary plot an MA plot because this type of plot was originally referred to as an MA plot in the limma package, with the M-value representing logFC and A-value representing average expression - it has since been renamed to MD plot in the limma package. The expression plot on the right displays sample expression values for a single gene. gfit <- edgeR::glmFit(dge, design)
glrt <- edgeR::glmLRT(gfit, design, contrast = contr.matrix)
glimmaMA(glrt, dge = dge)</pre>
```

glimmaMA.DGELRT

Glimma MA Plot

Description

Draws a two-panel interactive MA plot from an DGELRT object. This is a special case of the glimmaXY plot.

Usage

```
## S3 method for class 'DGELRT'
glimmaMA(
  х,
  dge = NULL,
  counts = dge$counts,
  groups = dge$samples$group,
  status = edgeR::decideTestsDGE(x),
  anno = x$genes,
  display.columns = NULL,
  status.cols = c("dodgerblue", "silver", "firebrick"),
  sample.cols = NULL,
  p.adj.method = "BH",
  transform.counts = c("logcpm", "cpm", "rpkm", "none"),
  main = paste(x$comparison[2], "vs", x$comparison[1]),
  xlab = "logCPM",
 ylab = "logFC",
 html = NULL,
 width = 920.
 height = 920,
)
```

Arguments

X	DGELRT object from which summary statistics are extracted from to create
	summary (left) plot

summary (left) plot.

dge DGEList object with nrow(x) rows from which expression values are extracted

from to create expression (right) plot. Gene counts are taken from dge\$counts

and sample groups from dge\$samples\$group.

counts numeric matrix with nrow(x) rows containing gene expression values. This can

be used to replace raw gene counts from dge\$counts with transformed counts

e.g. logCPM or logRPKM values.

vector of length ncol (dge) representing categorisation of samples in expression groups

plot.

status vector of length nrow(x) indicating the status of each gene. By default genes in

> the summary plot are coloured based on its differential expression status using an adjusted p-value cutoff of 0.05 by calling the edgeR::decideTestsDGE() function, where the value of -1 marks down-regulated genes, 0 marks genes

with no expression difference, and 1 marks up-regulated genes.

dataframe with nrow(x) rows containing gene annotations. anno

display.columns

character vector containing names of columns from anno from which to display

in mouseover tooltips and table.

status.cols vector of length 3 containing valid CSS strings for colours associated with status

in the order of -1, 0 and 1.

glimmaMA.DGELRT 11

sample.cols character vector of length ncol(counts) containing valid CSS strings for colours

associated with each sample to be displayed on the expression plot. If left un-

specified, samples will be coloured according to groups.

p.adj.method character string specifying p-value adjustment method.

transform.counts

the type of transform used on the counts log-cpm by default. edgeR::cpm(counts,log=TRUE);

defaults to FALSE.

main character string for the main title of summary plot.

xlab character string for the x-axis label of summary plot.

ylab character string for the y-axis label of summary plot.

html character string for naming HTML file for exportation of widget. The extension

should be included in the file name e.g. "file.html".

width numeric value indicating width of widget in pixels.

height numeric value indicating width of height in pixels.

... addition unused arguments.

glimmaMA.MArrayLM

Glimma MA Plot

Description

Draws a two-panel interactive MA plot from an MArrayLM object. This is a special case of the glimmaXY plot.

Usage

```
## S3 method for class 'MArrayLM'
glimmaMA(
 х,
  dge = NULL,
  counts = dge$counts,
  groups = dge$samples$group,
  coef = ncol(x$coefficients),
  status = limma::decideTests(x),
  anno = x$genes,
  display.columns = NULL,
  status.cols = c("dodgerblue", "silver", "firebrick"),
  sample.cols = NULL,
  p.adj.method = "BH",
  transform.counts = c("logcpm", "cpm", "rpkm", "none"),
 main = colnames(x)[coef],
 xlab = "logCPM",
 ylab = "logFC",
 html = NULL,
 width = 920,
 height = 920,
)
```

Arguments

X	MArrayLM object from which summary statistics are extracted from to create summary (left) plot.
dge	DGEList object with nrow(x) rows from which expression values are extracted from to create expression (right) plot. Gene counts are taken from dge\$counts and sample groups from dge\$samples\$group.
counts	numeric matrix with nrow(x) rows containing gene expression values. This can be used to replace raw gene counts from dge\$counts with transformed counts e.g. logCPM or logRPKM values.
groups	vector of length ncol(dge) representing categorisation of samples in expression plot.
coef	integer indicating the column in x from the summary plot is created.

status vector of length nrow(x) indicating the status of each gene. By default genes in

the summary plot are coloured based on its differential expression status using an adjusted p-value cutoff of 5% by calling the limma::decideTests function, where the value of -1 marks down-regulated genes, 0 marks genes with no ex-

pression difference, and 1 marks up-regulated genes.

anno dataframe with nrow(x) rows containing gene annotations.

display.columns

character vector containing names of columns from anno from which to display

in mouseover tooltips and table.

status.cols vector of length 3 containing valid CSS strings for colours associated with status

in the order of -1, 0 and 1.

sample.cols character vector of length ncol(counts) containing valid CSS strings for colours

associated with each sample to be displayed on the expression plot. If left un-

specified, samples will be coloured according to groups.

p.adj.method character string specifying p-value adjustment method.

transform.counts

the type of transform used on the counts log-cpm by default. edgeR::cpm(counts,log=TRUE);

defaults to FALSE.

main character string for the main title of summary plot.

xlab character string for the x-axis label of summary plot.

ylab character string for the y-axis label of summary plot.

html character string for naming HTML file for exportation of widget. The extension

should be included in the file name e.g. "file.html".

width numeric value indicating width of widget in pixels.

height numeric value indicating width of height in pixels.

... addition unused arguments.

efit <- limma::eBayes(vfit)
glimmaMA(efit, dge = dge)</pre>
```

glimmaMDS

Glimma MDS Plot

Description

Generic function for drawing a two-panel interactive MDS plot. The function invokes the following methods which depend on the class of the first argument:

- glimmaMDS.DGEList for edgeR analysis
- glimmaMDS.DESeqDataSet for DESeq2 analysis
- glimmaMDS.default for all other object types

Usage

```
glimmaMDS(x, ...)
```

Arguments

- x the matrix containing the gene expressions.
- the additional arguments affecting the plot produced. See specific methods for detailed arguments.

glimmaMDS.default 15

Details

The left plot shows two MDS dimensions, with sample annotations displayed on hover. The right panel contains a bar plot of the eigenvalues of each dimension. The controls beneath the plots can be used to change the dimensions being displayed, and the scale, colour and shape of points. The interactive MDS plot allows users to adjust sample points by scale, colour and shape for multiple vectors associated with sample information. This is carried out most effectively when x\$samples includes an abundance of sample information, or when a data frame object is supplied to groups. If a simple character or factor vector is given to groups (with the default of continous.colour=FALSE), then sample points will have no scaling options, but can only be adjusted in colour and shape by groups and labels. Instead, if groups is a numeric vector (e.g. library size or expression level of a specific gene), then the plot can be scaled and coloured by the numeric values with continous.colour=TRUE.

Value

htmlwidget object or NULL if html argument is specified.

Examples

```
dge <- readRDS(system.file("RNAseq123/dge.rds", package = "Glimma"))
glimmaMDS(dge)

# using DESeqDataSet
dds <- DESeq2::DESeqDataSetFromMatrix(
    countData = dge$counts,
    colData = dge$samples,
    rowData = dge$genes,
    design = ~group
)
glimmaMDS(dds)

# using matrix object
expr <- edgeR::cpm(dge, log = TRUE)
glimmaMDS(expr)</pre>
```

glimmaMDS.default

Glimma MDS Plot

Description

Draws a two-panel interactive MDS plot.

16 glimmaMDS.default

Usage

```
## Default S3 method:
glimmaMDS(
    x,
    groups = as.character(rep(1, ncol(x))),
    labels = as.character(seq_len(ncol(x))),
    continuous.colour = FALSE,
    top = 500,
    gene.selection = c("pairwise", "common"),
    html = NULL,
    width = 900,
    height = 500,
    ...
)
```

Arguments

x the matrix containing the gene expressions.

groups vector or data frame object with associated sample information such as experi-

mental groups. The information is displayed in mouseover tooltips, and appropriate vector(s) can be used to adjust the plot using scale_by, colour_by and

shape_by drop-down boxes of the widget.

labels character vector of sample names or labels.

continuous.colour

TRUE if continuous colour schemes should be used. Defaults to FALSE where

distinct colour schemes are used.

top integer indiating number of top genes used to calculate pairwise distances.

gene. selection character string specifying how genes are selected from the plot - "pairwise" if

most variable genes are to be chosen for each pair of samples, or "common" to

select the same genes for all comparisons.

html character string for naming HTML file or exportation of widget. The extension

should be included in the file name e.g. "file.hml".

width numeric value indicating width of widget in pixels.

height numeric value indicating width of widget in pixels.

... additional unused arguments.

```
{\tt glimmaMDS.DESeqDataSet}
```

Glimma MDS Plot

Description

Draws a two-panel interactive MDS plot using a DESeqDataset x. Transforms counts using edgeR::cpm(DESeq2::counts(x = TRUE,prior.count = prior.count).

Usage

```
## S3 method for class 'DESeqDataSet'
glimmaMDS(
    x,
    groups = as.data.frame(SummarizedExperiment::colData(x)),
    labels = rownames(SummarizedExperiment::colData(x)),
    continuous.colour = FALSE,
    top = 500,

    prior.count = 2,
    html = NULL,
    width = 900,
    height = 500,
    ...
)
```

Arguments

x DESeqDataSet object containing gene counts.

groups vector or data frame object with associated sample information such as experi-

mental groups. The information is displayed in mouseover tooltips, and appropriate vector(s) can be used to adjust the plot using scale_by, colour_by and

shape_by drop-down boxes of the widget.

labels character vector of sample names or labels.

continuous.colour

TRUE if continuous colour schemes should be used. Defaults to FALSE where

distinct colour schemes are used.

top integer indiating number of top genes used to calculate pairwise distances.

gene.selection character string specifying how genes are selected from the plot - "pairwise" if

most variable genes are to be chosen for each pair of samples, or "common" to

select the same genes for all comparisons.

prior.count integer indicating the average count to be added to each observation to avoid

taking log of zero when raw counts are transformed to log-counts-per-million

values.

html character string for naming HTML file or exportation of widget. The extension

should be included in the file name e.g. "file.hml".

width numeric value indicating width of widget in pixels.

height numeric value indicating width of widget in pixels.

... additional unused arguments.

Details

The left plot shows two MDS dimensions, with sample annotations displayed on hover. The right panel contains a bar plot of the eigenvalues of each dimension. The controls beneath the plots can be used to change the dimensions being displayed, and the scale, colour and shape of points. The interactive MDS plot allows users to adjust sample points by scale, colour and shape for multiple vectors associated with sample information. This is carried out most effectively when x\$samples includes an abundance of sample information, or when a data frame object is supplied to groups. If a simple character or factor vector is given to groups (with the default of continous.colour=FALSE), then sample points will have no scaling options, but can only be adjusted in colour and shape by groups and labels. Instead, if groups is a numeric vector (e.g. library size or expression level of a specific gene), then the plot can be scaled and coloured by the numeric values with continous.colour=TRUE.

Value

htmlwidget object or NULL if html argument is specified.

glimmaMDS.DGEList 19

Examples

```
dge <- readRDS(system.file("RNAseq123/dge.rds", package = "Glimma"))
dds <- DESeq2::DESeqDataSetFromMatrix(
   countData = dge$counts,
   colData = dge$samples,
   rowData = dge$genes,
   design = ~group
)
glimmaMDS(dds)</pre>
```

glimmaMDS.DGEList

Glimma MDS Plot

Description

Draws a two-panel interactive MDS plot using a DGEList x. Transforms counts using edgeR::cpm(x,log=TRUE,prior.count).

Usage

```
## S3 method for class 'DGEList'
glimmaMDS(
    x,
    groups = x$samples,
    labels = rownames(x$samples),
    continuous.colour = FALSE,
    top = 500,
    gene.selection = c("pairwise", "common"),
    prior.count = 2,
    html = NULL,
    width = 900,
    height = 500,
    ...
)
```

Arguments

x DGEList object containing gene counts in x\$counts.

groups

vector or data frame object with associated sample information such as experimental groups. The information is displayed in mouseover tooltips, and appropriate vector(s) can be used to adjust the plot using scale_by, colour_by and shape_by drop-down boxes of the widget.

labels character vector of sample names or labels.

continuous.colour

TRUE if continuous colour schemes should be used. Defaults to FALSE where distinct colour schemes are used.

glimmaMDS.DGEList

top integer indiating number of top genes used to calculate pairwise distances.

gene.selection character string specifying how genes are selected from the plot - "pairwise" if

most variable genes are to be chosen for each pair of samples, or "common" to

select the same genes for all comparisons.

prior.count integer indicating the average count to be added to each observation to avoid

taking log of zero when raw counts are transformed to log-counts-per-million

values.

html character string for naming HTML file or exportation of widget. The extension

should be included in the file name e.g. "file.hml".

width numeric value indicating width of widget in pixels.

height numeric value indicating width of widget in pixels.

glimmaVolcano 21

glimmaVolcano

Glimma Volcano Plot

Description

Generic function for drawing a two-panel interactive volcano plot, a special case of the glimmaXY plot. The function invokes the following methods which depend on the class of the first argument:

- glimmaVolcano.MArrayLM for limma analysis
- glimmaVolcano.DGEExact for edgeR analysis, produced from exactTest
- glimmaVolcano.DGELRT for edgeR analysis, produced from glmLRT
- glimmaVolcano.DESeqDataSet for DESeq2 analysis

Usage

```
glimmaVolcano(x, ...)
```

Arguments

- x the DE object to plot.
- ... additional arguments affecting the plots produced. See specific methods for detailed arguments.

Details

The summary plot on the left represents gene-wise log-fold-change (logFC) on the x-axis versus -log10(pvalue). The expression plot on the right displays sample expression values for a single gene. Interactions with the htmlwidget include clicking on genes (points) in the summary plot to bring up associated sample expression values in the expression plot, as well as the summary statistics in the table below. Alternatively, users can interact with the table by clicking on genes (rows) to highlight genes in the summary plot, as well as bring up associated sample expression values in the expression plot. Briefly, other interactive features include a search box for the table, buttons to save plots and data (summary statistics and expression values), additional pop-up information when hovering on points in plots, and rescaling of the y-axis in the expression plot.

Value

htmlwidget object or NULL if html argument is specified.

Examples

```
dge <- readRDS(
   system.file("RNAseq123/dge.rds", package = "Glimma"))
design <- readRDS(
   system.file("RNAseq123/design.rds", package = "Glimma"))
contr.matrix <- readRDS(
   system.file("RNAseq123/contr.matrix.rds", package = "Glimma"))</pre>
```

```
v <- limma::voom(dge, design)
vfit <- limma::lmFit(v, design)
vfit <- limma::contrasts.fit(vfit, contrasts = contr.matrix)
efit <- limma::eBayes(vfit)
glimmaVolcano(efit, dge = dge)</pre>
```

glimmaVolcano.DESeqDataSet

Glimma Volcano Plot

Description

Draws a two-panel interactive volcano plot from an DESeqDataSet object. This is a special case of the glimmaXY plot.

Usage

```
## S3 method for class 'DESeqDataSet'
glimmaVolcano(
 х,
  counts = DESeq2::counts(x),
 groups = extractGroups(colData(x)),
 status = NULL,
  anno = NULL,
 display.columns = NULL,
  status.cols = c("dodgerblue", "silver", "firebrick"),
  sample.cols = NULL,
  transform.counts = c("logcpm", "cpm", "rpkm", "none"),
 main = "Volcano Plot",
 xlab = "logFC",
 ylab = "negLog10PValue",
 html = NULL,
 width = 920,
 height = 920,
)
```

Arguments

x DESeqDataSet object from which summary statistics are extracted from to create summary (left) plot.

counts numeric matrix with nrow(x) rows containing gene expression values.

groups vector/factor representing the experimental group for each sample; see extractGroups for default value.

status vector of length nrow(x) indicating the status of each gene.

anno dataframe with nrow(x) rows containing gene annotations.

display.columns

character vector containing names of columns from anno from which to display

in mouseover tooltips and table.

status.cols vector of length 3 containing valid CSS strings for colours associated with status

in the order of -1, 0 and 1.

sample.cols character vector of length ncol (counts) containing valid CSS strings for colours

associated with each sample to be displayed on the expression plot. If left un-

specified, samples will be coloured according to groups.

transform.counts

the type of transform used on the counts log-cpm by default. edgeR::cpm(counts,log=TRUE);

defaults to FALSE.

main character string for the main title of summary plot.

xlab character string for the x-axis label of summary plot.

ylab character string for the y-axis label of summary plot.

html character string for naming HTML file for exportation of widget. The extension

should be included in the file name e.g. "file.html".

width numeric value indicating width of widget in pixels.

height numeric value indicating width of height in pixels.

... addition unused arguments.

Details

The summary plot on the left represents gene-wise log-fold-change (logFC) on the x-axis versus -log10(pvalue). The expression plot on the right displays sample expression values for a single gene. Interactions with the htmlwidget include clicking on genes (points) in the summary plot to bring up associated sample expression values in the expression plot, as well as the summary statistics in the table below. Alternatively, users can interact with the table by clicking on genes (rows) to highlight genes in the summary plot, as well as bring up associated sample expression values in the expression plot. Briefly, other interactive features include a search box for the table, buttons to save plots and data (summary statistics and expression values), additional pop-up information when hovering on points in plots, and rescaling of the y-axis in the expression plot.

Value

htmlwidget object or NULL if html argument is specified.

   design = ~group
)

dds <- DESeq2::DESeq(dds, quiet=TRUE)
glimmaVolcano(dds)</pre>
```

glimmaVolcano.DGEExact

Glimma Volcano Plot

Description

Draws a two-panel interactive volcano plot from an DGEExact object. This is a special case of the glimmaXY plot.

Usage

```
## S3 method for class 'DGEExact'
glimmaVolcano(
  х,
  dge = NULL,
  counts = dge$counts,
  groups = dge$samples$group,
  status = edgeR::decideTestsDGE(x),
  anno = x$genes,
  display.columns = NULL,
  status.cols = c("dodgerblue", "silver", "firebrick"),
  sample.cols = NULL,
  p.adj.method = "BH",
  transform.counts = c("logcpm", "cpm", "rpkm", "none"),
  main = paste(x$comparison[2], "vs", x$comparison[1]),
  xlab = "logFC",
  ylab = "negLog10PValue",
 html = NULL,
 width = 920,
 height = 920,
)
```

Arguments

	X	DGEExact object from which summary statistics are extracted from to create summary (left) plot.
	dge	DGEList object with nrow(x) rows from which expression values are extracted from to create expression (right) plot. Gene counts are taken from dge\$counts and sample groups from dge\$samples\$group.
	counts	numeric matrix with nrow(x) rows containing gene expression values. This can be used to replace raw gene counts from dge\$counts with transformed counts e.g. logCPM or logRPKM values.
	groups	vector of length ncol (dge) representing categorisation of samples in expression plot.
	status	vector of length nrow(x) indicating the status of each gene. By default genes in the summary plot are coloured based on its differential expression status using an adjusted p-value cutoff of 0.05 by calling the edgeR::decideTestsDGE() function, where the value of -1 marks down-regulated genes, 0 marks genes with no expression difference, and 1 marks up-regulated genes.
	anno	dataframe with nrow(x) rows containing gene annotations.
	display.columns	
		character vector containing names of columns from anno from which to display in mouseover tooltips and table.
	status.cols	vector of length 3 containing valid CSS strings for colours associated with status in the order of -1, 0 and 1.
	sample.cols	character vector of length ncol(counts) containing valid CSS strings for colours associated with each sample to be displayed on the expression plot. If left unspecified, samples will be coloured according to groups.
	p.adj.method	character string specifying p-value adjustment method.
transform.counts		
		the type of transform used on the counts log-cpm by default. edgeR::cpm(counts,log=TRUE); defaults to FALSE.
	main	character string for the main title of summary plot.
	xlab	character string for the x-axis label of summary plot.
	ylab	character string for the y-axis label of summary plot.
	html	character string for naming HTML file for exportation of widget. The extension should be included in the file name e.g. "file.html".
	width	numeric value indicating width of widget in pixels.
	height	numeric value indicating width of height in pixels.
		addition unused arguments.

  transform.counts = c("logcpm", "cpm", "rpkm", "none"),
  main = paste(x$comparison[2], "vs", x$comparison[1]),
  xlab = "logFC",
  ylab = "negLog10PValue",
  html = NULL,
  width = 920,
  height = 920,
  ...
)
```

Arguments

x DGELRT object from which summary statistics are extracted from to create

summary (left) plot.

dge DGEList object with nrow(x) rows from which expression values are extracted

from to create expression (right) plot. Gene counts are taken from dge\$counts

and sample groups from dge\$samples\$group.

counts numeric matrix with nrow(x) rows containing gene expression values. This can

be used to replace raw gene counts from dge\$counts with transformed counts

e.g. logCPM or logRPKM values.

groups vector of length ncol (dge) representing categorisation of samples in expression

plot.

status vector of length nrow(x) indicating the status of each gene. By default genes in

the summary plot are coloured based on its differential expression status using an adjusted p-value cutoff of 0.05 by calling the edgeR::decideTestsDGE() function, where the value of -1 marks down-regulated genes, 0 marks genes

with no expression difference, and 1 marks up-regulated genes.

anno dataframe with nrow(x) rows containing gene annotations.

display.columns

character vector containing names of columns from anno from which to display

in mouseover tooltips and table.

status.cols vector of length 3 containing valid CSS strings for colours associated with status

in the order of -1, 0 and 1.

sample.cols character vector of length ncol (counts) containing valid CSS strings for colours

associated with each sample to be displayed on the expression plot. If left un-

specified, samples will be coloured according to groups.

p.adj.method character string specifying p-value adjustment method.

transform.counts

the type of transform used on the counts log-cpm by default. edgeR::cpm(counts,log=TRUE);

defaults to FALSE.

main character string for the main title of summary plot.

xlab	character string for the x-axis label of summary plot.
ylab	character string for the y-axis label of summary plot.
html	character string for naming HTML file for exportation of widget. The extension should be included in the file name e.g. "file.html".
width	numeric value indicating width of widget in pixels.
height	numeric value indicating width of height in pixels.
	addition unused arguments.

Details

The summary plot on the left represents gene-wise log-fold-change (logFC) on the x-axis versus -log10(pvalue). The expression plot on the right displays sample expression values for a single gene. Interactions with the htmlwidget include clicking on genes (points) in the summary plot to bring up associated sample expression values in the expression plot, as well as the summary statistics in the table below. xlab = "logFC",
ylab = "negLog10PValue",
html = NULL,
width = 920,
height = 920,
...
)
```

Arguments

x MArrayLM object from which summary statistics are extracted from to create

summary (left) plot.

dge DGEList object with nrow(x) rows from which expression values are extracted

from to create expression (right) plot. Gene counts are taken from dge\$counts

and sample groups from dge\$samples\$group.

counts numeric matrix with nrow(x) rows containing gene expression values. This can

be used to replace raw gene counts from dge\$counts with transformed counts

e.g. logCPM or logRPKM values.

groups vector of length ncol(dge) representing categorisation of samples in expression

plot.

coef integer indicating the column in x from the summary plot is created.

status vector of length nrow(x) indicating the status of each gene. By default genes in

the summary plot are coloured based on its differential expression status using an adjusted p-value cutoff of 5% by calling the limma::decideTests function, where the value of -1 marks down-regulated genes, 0 marks genes with no ex-

pression difference, and 1 marks up-regulated genes.

anno dataframe with nrow(x) rows containing gene annotations.

display.columns

character vector containing names of columns from anno from which to display

in mouseover tooltips and table.

status.cols vector of length 3 containing valid CSS strings for colours associated with status

in the order of -1, 0 and 1.

sample.cols character vector of length ncol (counts) containing valid CSS strings for colours

associated with each sample to be displayed on the expression plot. If left un-

specified, samples will be coloured according to groups.

p.adj.method character string specifying p-value adjustment method.

transform.counts

the type of transform used on the counts log-cpm by default. edgeR::cpm(counts,log=TRUE); defaults to FALSE.

30 glimmaXY

main	character string for the main title of summary plot.
xlab	character string for the x-axis label of summary plot.

transform.counts = c("logcpm", "cpm", "rpkm", "none"),
main = "XY Plot",
html = NULL,
width = 920,
height = 920
)
```

Arguments

x numeric vector of values to plot on the x-axis of the summary plot.

y numeric vector of values to plot on the y-axis of the summary plot.

xlab character string for the x-axis label of summary plot.
ylab character string for the y-axis label of summary plot.

counts numeric matrix with length(x) rows containing gene expression values. This

can be used to replace raw gene counts from dge\$counts with transformed counts

e.g. logCPM or logRPKM values.

groups vector of length ncol(counts) representing categorisation of samples in ex-

pression plot.

status vector of length length(x) indicating the status of each gene. A value of -1

marks a down-regulated gene, 0 marks a gene with no expression difference,

and 1 marks an up-regulated gene.

anno dataframe with length(x) rows containing gene annotations.

display.columns

character vector containing names of columns from anno from which to display

in mouseover tooltips and table.

status.cols vector of length 3 containing valid CSS strings for colours associated with status

in the order of -1, 0 and 1.

sample.cols character vector of length ncol(counts) containing valid CSS strings for colours

associated with each sample to be displayed on the expression plot. If left un-

specified, samples will be coloured according to groups.

transform.counts

the type of transform used on the counts log-cpm by default. edgeR::cpm(counts,log=TRUE);

defaults to FALSE.

main character string for the main title of summary plot.

html character string for naming HTML file for exportation of widget. The extension

should be included in the file name e.g. "file.html".

width numeric value indicating width of widget in pixels.

height numeric value indicating width of height in pixels.

32 glMDPlot

Details

The summary plot on the left displays the x and y values specified. The expression plot on the right displays sample expression values for a single gene. Interactions with the htmlwidget include clicking on genes (points) in the summary plot to bring up associated sample expression values in the expression plot, as well as the summary statistics in the table below. Alternatively, users can interact with the table by clicking on genes (rows) to highlight genes in the summary plot, as well as bring up associated sample expression values in the expression plot. Briefly, other interactive features include a search box for the table, buttons to save plots and data (summary statistics and expression values), additional pop-up information when hovering on points in plots, and rescaling of the y-axis in the expression plot.

Value

htmlwidget object or NULL if html argument is specified.

Examples

```
dge <- readRDS(
   system.file("RNAseq123/dge.rds", package = "Glimma"))
design <- readRDS(
   system.file("RNAseq123/design.rds", package = "Glimma"))
contr.matrix <- readRDS(
   system.file("RNAseq123/contr.matrix.rds", package = "Glimma"))

v <- limma::voom(dge, design)
vfit <- limma::lmFit(v, design)
vfit <- limma::contrasts.fit(vfit, contrasts = contr.matrix)
efit <- limma::eBayes(vfit)

glimmaXY(efit$Amean, efit$coefficients)</pre>
```

glMDPlot

Glimma MD Plot

Description

Draw an interactive MD plot

Usage

```
glMDPlot(x, ...)
```

Arguments

x the DE object to plot.

additional arguments affecting the plots produced. See specific methods for detailed arguments.

glMDPlot 33

Value

Draws a two-panel interactive MD plot in an html page. The left plot shows the log-fold-change vs average expression. The right plot shows the expression levels of a particular gene of each sample. Hovering over points on left plot will plot expression level for corresponding gene, clicking on points will fix the expression plot to gene. Clicking on rows on the table has the same effect as clicking on the corresponding gene in the plot.

```

34 glMDPlot.default

glMDPlot.default

Glimma MD Plot

Description

Draw an interactive MD plot from a data.frame

Usage

```
## Default S3 method:
glMDPlot(
 х,
 xval,
 yval,
  counts = NULL,
  anno = NULL,
  groups = NULL,
  samples = NULL,
  status = rep(0, nrow(x)),
  transform = FALSE,
 main = "",
 xlab = xval,
  ylab = yval,
  side.main = "GeneID",
  side.xlab = "Group",
  side.ylab = "Expression",
  side.log = FALSE,
  side.gridstep = ifelse(!transform || side.log, FALSE, 0.5),
  jitter = 30,
  display.columns = side.main,
  cols = c("#00bfff", "#858585", "#ff3030"),
  sample.cols = rep("#1f77b4", ncol(counts)),
  path = getwd(),
  folder = "glimma-plots",
  html = "MD-Plot",
  launch = TRUE,
)
```

Arguments

X	the data.frame object containing expression and fold change values.
xval	the column to plot on x axis of left plot.
yval	the column to plot on y axis of left plot.
counts	the matrix of expression values, with samples in columns.
anno	the data.frame containing gene annotations.

gIMDPlot.default 35

groups the factor containing experimental groups of the samples.

samples the names of the samples.

status vector giving the control status of data point, of same length as the number of

rows of object. If NULL, then all points are plotted in the default colour.

transform TRUE if counts should be log-cpm transformed.

main the title for the left plot.

xlab the label on the x axis for the left plot.
ylab the label on the y axis for the left plot.
side.main the column containing mains for right plot.

side.xlab label for x axis on right plot. side.ylab label for y axis on right plot.

side.log TRUE to plot expression on the right plot on log scale.

side.gridstep intervals along which to place grid lines on y axis. Currently only available for

linear scale.

jitter the amount of jitter to apply to the samples in the expressions plot.

display.columns

character vector containing names of columns to display in mouseover tooltips

and table.

cols vector of strings denoting colours corresponding to control status -1, 0 and 1.

(may be R named colours or Hex values)

sample.cols vector of strings denoting colours for each sample point on the expression plot.

path the path in which the folder will be created.

folder the name of the fold to save html file to.

html the name of the html file to save plots to.

launch TRUE to launch plot after call.

... additional arguments to be passed onto the MD plot. (main, xlab, ylab can be

set for the left plot)

Value

Draws a two-panel interactive MD plot in an html page. The left plot shows the log-fold-change vs average expression. The right plot shows the expression levels of a particular gene of each sample. Hovering over points on left plot will plot expression level for corresponding gene, clicking on points will fix the expression plot to gene. Clicking on rows on the table has the same effect as clicking on the corresponding gene in the plot.

Examples

```
library(limma)
library(edgeR)
data(lymphomaRNAseq)
x <- lymphomaRNAseq
sel <- rowSums(cpm(x$counts)>0.5)>=3
x \leftarrow x[sel,]
genotype <- relevel(x$samples$group, "Smchd1-null")</pre>
x <- calcNormFactors(x, method="TMM")</pre>
des <- model.matrix(~genotype)</pre>
## Apply voom with sample quality weights and fit linear model
v <- voomWithQualityWeights(x, design=des, plot=FALSE)</pre>
vfit <- lmFit(v,des)</pre>
## Apply treat relative to a fold-change of 1.5
vtfit <- treat(vfit,lfc=log2(1.5))</pre>
vfit <- eBayes(vfit)</pre>
results <- decideTests(vfit,p.value=0.01)</pre>
glMDPlot(vfit, counts=x$counts, anno=x$genes, groups=genotype, samples=1:7,
         status=results[,2], main="MD plot: Wild-type vs Smchd1",
         display.columns=c("Symbols", "GeneID", "GeneName"),
          folder="Smchd1-Lymphoma")
```

glMDRmd

glMDPlot Rmarkdown link and instructions

Description

When run inside of a text-block of Rmarkdown document using 'r ...' this produces a link and instructions about the usage of the interactive plots.

Usage

```
glMDRmd(html = "MD-Plot")
```

Arguments

html

name of the HTML page containing plots from glMDPlot.

glMDSPlot 47

Value

None

See Also

```
glMDPlot
```

Examples

glMDRmd()

glMDSPlot

Glimma MDS Plot

Description

Draw an interactive MD plot from a DGEList object with distances calculated from most variable genes.

Usage

```
glMDSPlot(x, ...)
```

Arguments

x the matrix containing the gene expressions.

... additional arguments.

Value

Draws a two-panel interactive MDS plot in an html page. The left panel contains the plot between two MDS dimensions, with annotations displayed on hover. The right panel contains a bar plot of the eigenvalues of each dimension, clicking on any of the bars will plot the corresponding dimension against the next dimension.

Author(s)

Shian Su, Gordon Smyth

genotype <- relevel(lymphomaRNAseq$samples$group, "Smchd1-null")
glMDSPlot(lymphomaRNAseq, labels=1:7, groups=genotype)</pre>
```

glMDSPlot.default

Glimma MDS Plot

Description

Draw an interactive MD plot from a DGEList object with distances calculated from most variable genes.

Usage

```
## Default S3 method:
glMDSPlot(
    x,
    top = 500,
    labels = seq_cols(x),
    groups = rep(1, ncol(x)),
    gene.selection = c("pairwise", "common"),
    main = "MDS Plot",
    path = getwd(),
    folder = "glimma-plots",
    html = "MDS-Plot",
    launch = TRUE,
    ...
)
```

Arguments

x the matrix containing the gene expressions. top the number of top most variable genes to use.

labels the labels for each sample.

groups the experimental group to which samples belong.

gene.selection "pairwise" if most variable genes are to be chosen for each pair of samples or

"common" to select the same genes for all comparisons.

main the title of the plot.

path the path in which the folder will be created.
folder the name of the fold to save html file to.
html the name of the html file to save plots to.

launch TRUE to launch plot after call.

... additional arguments.

Value

Draws a two-panel interactive MDS plot in an html page. The left panel contains the plot between two MDS dimensions, with annotations displayed on hover. The right panel contains a bar plot of the eigenvalues of each dimension, clicking on any of the bars will plot the corresponding dimension against the next dimension.

glXYPlot Glimma XY Plot

Description

Draw an interactive XY plot with multiple panels

Usage

```
glXYPlot(
    x,
    y,
    counts = NULL,
    groups = NULL,
    samples = NULL,
    status = rep(0, nrow(data)),
```

52 glXYPlot

```
anno = NULL,
display.columns = NULL,
xlab = "x",
ylab = "y",
side.main = "GeneID",
side.xlab = "Group",
side.ylab = "Expression",
sample.cols = rep("#1f77b4", length(groups)),
cols = c("#00bfff", "#858585", "#ff3030"),
jitter = 30,
path = getwd(),
folder = "glimma-plots",
html = "XY-Plot",
launch = TRUE,
...
)
```

Arguments

x a numeric vector of values to plot on the x-axis of the summary plot.
y a numeric vector of values to plot on the y-axis of the summary plot.

counts the matrix containing all counts, the column order should correspond to the order

of the x and y vectors.

groups the factor containing experimental groups of the samples.

samples the names of the samples.

status vector giving the control status of data point, of same length as the number of

rows of object. If NULL, then all points are plotted in the default colour

anno the data.frame containing gene annotations.

display.columns

character vector containing names of columns to display in mouseover tooltips

and table.

xlab the label on the x axis for the left plot.
ylab the label on the y axis for the left plot.
side.main the column containing mains for right plot.
side.xlab the label on the x axis for the right plot.
side.ylab the label on the y axis for the right plot.

sample.cols vector of strings denoting colours for each sample point on the expression plot.

vector of strings denoting colours corresponding to control status -1, 0 and 1.

(may be R named colours or Hex values)

jitter the amount of jitter to apply to the samples in the expressions plot.

path the path in which the folder will be created.

folder the name of the fold to save html file to.

html the name of the html file to save plots to.

is.hex 53

launch TRUE to launch plot after call.

additional arguments to be passed onto the MD plot. (main, etc. can be set for the left plot)

Value

Draws a two-panel interactive XY scatter plot in an html page. The left plot shows the x and y values specified. The right plot shows the expression levels of a particular gene in each sample. Hovering over points on left plot will plot expression level for the corresponding gene, clicking on points will fix the expression plot to that gene. Clicking on rows on the table has the same effect as clicking on the corresponding gene in the plot. This function generates a display that is similar in style to glMDPlot, except that it provides more flexibility in what the user can provide.

Author(s)

Charity Law and Shian Su

Examples

is.hex

Hexcode colours

Description

Check if string(s) are valid hex colour representation

Usage

```
is.hex(x)
```

Arguments

Х

the colour value(s) to check.

Value

Logical vector indicating if strings(s) are valid hex representations

54 lymphomaRNAseq

 ${\tt lymphomaRNAseq}$

Mouse based RNAseq data for study of smchd1 gene.

Description

Mouse based RNAseq data for study of smchd1 gene.

Author(s)
