# Package 'SummarizedBenchmark'

June 7, 2023

Type Package

Title Classes and methods for performing benchmark comparisons

**Version** 2.19.0

BugReports https://github.com/areyesq89/SummarizedBenchmark/issues

 $\label{lower_lower_lower} \textbf{URL} \ \ \textbf{https://github.com/areyesq89/SummarizedBenchmark},$ 

http://bioconductor.org/packages/SummarizedBenchmark/

**Description** This package defines the BenchDesign and SummarizedBenchmark classes for building, executing, and evaluating benchmark experiments of computational methods. The Summarized-Benchmark

class extends the RangedSummarizedExperiment object, and is designed to provide infrastructure to store and compare the results of applying different methods to a shared data set.

This class provides an integrated interface to store metadata such as method parameters and software

versions as well as ground truths (when these are available) and evaluation metrics.

biocViews Software, Infrastructure

**Depends** R (>= 3.6), tidyr, SummarizedExperiment, S4Vectors, BiocGenerics, methods, UpSetR, rlang, stringr, utils, BiocParallel, ggplot2, mclust, dplyr, digest, sessioninfo, crayon, tibble

**Suggests** iCOBRA, BiocStyle, rmarkdown, knitr, magrittr, IHW, qvalue, testthat, DESeq2, edgeR, limma, tximport, readr, scRNAseq, splatter, scater, rnaseqcomp, biomaRt

Modify BenchDesign Method

# Description

.modmethod

Given a method defined in a BenchDesign, this helper function returns a modified method with new parameters defined as a list of quosures.

# Usage

```
.modmethod(m, q, .overwrite)
```

# **Arguments**

m method

q quosure list of new parameters

.overwrite logical whether to overwrite parameters

# Value

modified method.

Add method to BenchDesign object

### **Description**

Takes a BenchDesign object and the definition of a new method for benchmarking and returns the original BenchDesign with the new method included.

At a minimum, a method label (label =), and the workhorse function for the method (func =) must be specified for the new method.

Parameters for the method must be specified as a quos named list of parameter = value pairs mapping entries in the benchmarking data to the function parameters. For users familiar with the **ggplot2** package, this can be viewed similar to the aes = mapping of data to geometry parameters.

An optional secondary function, post, can be specified if the output of the workhorse function, func, needs to be further processed. As an example, post may be a simple "getter" function for accessing the column of interest from the large object returned by func.

### Usage

```
addMethod(bd, label, func, params = rlang::quos(), post = NULL,
  meta = NULL)
```

### **Arguments**

bd	BenchDesign objec
----	-------------------

label Character name for the method.

func Primary function to be benchmarked.

params Named quosure list created using quos of parameter = value pairs to be passed

to func.

post Optional post-processing function that takes results of func as input. Ignored if

NULL. If multiple assays (metrics) should be generated for each method, this can be accomplished by specifying a named list of post-processing functions, one

for each assay. (default = NULL)

meta Optional metadata information for method to be included in colData of SummarizedBenchmark

object generated using link{buildBench}. See Details for more information.

Ignored if NULL. (default = NULL)

#### Details

The optional meta parameter accepts a named list of metadata tags to be included for the method in the resulting SummarizedBenchmark object. This can be useful for two primary cases. First, it can help keep analyses better organized by allowing the specification of additional information that should be stored with methods, e.g. a tag for "method type" or descriptive information on why the method was included in the comparison. Second, and more improtantly, the meta parameter can be used to overwrite the package and version information that is automatically extracted from the function specified to func. This is particularly useful when the function passed to func is a

addPerformanceMetric 5

wrapper for a script in (or outside of) R, and the appropriate package and version information can't be directly pulled from func. In this case, the user can either manually specify the "pkg\_name" and "pkg\_vers" values to meta as a list, or specify a separate function that should be used to determine the package name and version. If a separate function should be used, it should be passed to meta as a list entry with the name pkg\_func and first quoted using quo, e.g. list(pkg\_func = quo(p.adjust)).

#### Value

Modified BenchDesign object with new method added.

# Author(s)

Patrick Kimes

modifyMethod, expandMethod, dropMethod

### **Examples**

addPerformanceMetric Add performance metric to SummarizedBenchmark object

### Description

This is a function to define performance metrics for benchmarking methods. The function is saved into the performanceMetrics slot.

### Usage

```
addPerformanceMetric(object, evalMetric, assay, evalFunction = NULL)
```

6 allSB

# **Arguments**

object A SummarizedBenchmark object.

evalMetric A string with the name of the evaluation metric.

assay A string with an assay name. Indicates the assay that should be given as input to

this performance metric.

evalFunction A function that calculates a performance metric. It should contain at least two

arguments, query and truth, where query is the output vector of a method and truth is the vector of true values. If additional parameters are specified, they must contain default values. If NULL, the 'evalMetric' string must be the name of a predefined metric available through 'evallable Metrics' () function ()

of a predefined metric available through 'availableMetrics()\$function'.

### Value

A SummarizedBenchmark object.

#### Author(s)

Alejandro Reyes

#### See Also

availableMetrics, performanceMetrics

# **Examples**

```
data( sb )
sb <- addPerformanceMetric(
   object=sb,
   assay="qvalue",
   evalMetric="TPR",
   evalFunction = function( query, truth, alpha=0.1 ){
      goodHits <- sum( (query < alpha) & truth == 1 )
      goodHits / sum(truth == 1)
   }
)</pre>
```

allSB

SummarizedBenchmark object of isoform quantification results

### **Description**

This object is a SummarizedBenchmark object containing isoform quantifications from salmon, sailfish and kallisto from 4 mouse samples (2 hearts and 2 brains) part of the Mouse BodyMap. Its generation is described in one of the vignettes of this package.

### **Source**

Mouse BodyMap (Li et al, 2014). SRA accession numbers SRR5273705, SRR5273689, SRR5273699 and SRR5273683.

# **Examples**

```
data(quantSB)
```

```
assayNames<-,SummarizedBenchmark,character-method

Set assay names in SummarizedBenchmark object
```

# Description

Modifies the assay names of a SummarizedBenchmark object.

### Usage

```
## S4 replacement method for signature 'SummarizedBenchmark,character' assayNames(x, \ldots) <- value
```

# Arguments

x A SummarizedBenchmark object.

Futher arguments, perhaps used by methods.

value A character vector.

### Value

Modfied SummarizedBenchmark object.

# Author(s)

Alejandro Reyes

# See Also

SummarizedBenchmark

```
data(sb)
assayNames(sb)[2] <- "log2FC"</pre>
```

8 BDData

availableMetrics

List pre-defined metrics for SummarizedBenchmark objects

# **Description**

This function returns a data frame summarizing the default performance metrics provided in this package. The data frame contains three columns, functions is the name of the performance metric, description is longer description of the performance metric and requiredTruth is logical depending on whether the performance metrics require ground truths.

# Usage

```
availableMetrics()
```

#### Value

A data.frame summarizing the default performance metrics provided in this package.

### Author(s)

Alejandro Reyes

# **Examples**

availableMetrics()

**BDData** 

Create a new BDData object

# **Description**

Initializes a new BDData object of benchmarking data.

Data sets are stored as BDData objects within BenchDesign objects as well as SummarizedBenchmark objects. However, because data is directly specified to the BenchDesign constructor, there is usually no need to call the BDData constructor to create completely new data objects.

The BDData constructor is most useful for extracting the data sets contained in BenchDesign objects as well as SummarizedBenchmark objects. By default, the BDData object stored in SummarizedBenchmark objects will be MD5 hashes rather than the complete original data set. compareBDData can be used to compare various forms of BDData, as shown in the examples below.

BDData 9

# Usage

```
BDData(data)

## S4 method for signature 'ANY'
BDData(data)

## S4 method for signature 'BenchDesign'
BDData(data)

## S4 method for signature 'SummarizedBenchmark'
BDData(data)

## S4 method for signature 'BDData'
BDData(data)
```

# Arguments

data

a list object of data or MD5 hash string

#### Value

BDData object

# Author(s)

Patrick Kimes

# See Also

```
BDData-class, BenchDesign
```

```
## construct from data.frame
datadf <- data.frame(x = 1:5, y = runif(5))
bdd_df <- BDData(datadf)
bdd_df

## construct from MD5 hash of data.frame
bdd_md5 <- BDData(digest::digest(datadf))
bdd_md5

## compare two BDData objects
compareBDData(bdd_df, bdd_md5)

## note that the data is the same, i.e. the MD5 hashes match, but the
## data types ("data" vs. "md5has") are different</pre>
```

10 BDData<-

BDData-class

BDData class

# **Description**

Container for data in a BenchDesign object.

#### **Slots**

```
data a list or MD5 hash of the data.
```

type a character string indicating whether the data slot contains the 'data' or a 'md5hash' of the data.

# Author(s)

Patrick Kimes

BDData, BenchDesign-class, BDMethod-class, BDMethodList-class

BDData<-

Set data in BenchDesign object

# **Description**

Adds, removes or replaces BDData in BenchDesign object. Data can be removed by setting the value to NULL.

# Usage

```
BDData(x) <- value
## S4 replacement method for signature 'BenchDesign,BDDataOrNULL'
BDData(x) <- value</pre>
```

# **Arguments**

x BenchDesign object.
value BDData or NULL.

### Value

modified BenchDesign object

BDMethod 11

### Author(s)

Patrick Kimes

# See Also

**BDData** 

# **Examples**

```
bd <- BenchDesign()
BDData(bd) <- BDData(data.frame(x1 = runif(5)))
bd</pre>
```

**BDMethod** 

Create a new BDMethod object

# **Description**

Initializes a new BenchDesign method object for benchmarking.

New BDMethod objects are typically not directly constructed as they have limited use outside of BenchDesign objects. Instead, methods in a BenchDesign object are more commonly created, modified or removed using function calls on the BenchDesign, e.g. using addMethod to add a new method object.

The constructor can also be used to access BDMethod objects stored in BDMethodList and BenchDesign objects.

# Usage

```
BDMethod(x, params = rlang::quos(), post = NULL, meta = NULL, ...)
## S4 method for signature 'quosure'
BDMethod(x, params = rlang::quos(), post = NULL,
    meta = NULL, ...)
## S4 method for signature '`function`'
BDMethod(x, params = rlang::quos(), post = NULL,
    meta = NULL, ...)
## S4 method for signature 'BDMethodList'
BDMethod(x, i = 1)
## S4 method for signature 'BenchDesign'
BDMethod(x, i = 1)
```

12 BDMethod-class

# **Arguments**

х	main method function or function quosure. Alternative, may be a BDMethodList or BenchDesign object from which the BDMethod should be extracted.
params	list of quosures specifying function parameters. (default = rlang::quos())
post	list of functions to be applied to the output of $x$ . (default = $NULL$ )
meta	list of metadata. (default = NULL)
	other parameters.
i	integer index or character name of BDMethod in BDMethodList or BenchDesign object.

#### Value

BDMethod object

# Author(s)

Patrick Kimes

#### See Also

```
BDMethod-class, BenchDesign, BDMethodList
```

# **Examples**

BDMethod-class

BDMethod class

# Description

Container for individual methods to be compared as part of a benchmark experiment defined in a BenchDesign object. In the SummarizedBenchmark framework, methods are defined by a unique combination of functions, parameters, and any relevant meta data.

New BDMethod objects can be created using the BDMethod constructor.

BDMethod<-

### **Slots**

```
f a function to be benchmarked
fc a captured expression of the function f
params a list of quosures specifying function parameters
post a list of functions to be applied to the output of f
meta a list of meta data
```

#### Author(s)

Patrick Kimes

#### See Also

BDMethod, BenchDesign-class, BDMethodList-class, BDData-class

BDMethod<-

Set method in list or BenchDesign object

# **Description**

Adds, replaces or removes a named BDMethod method in a BDMethodList or BenchDesign object with a specified BDMethod object.

An existing method can be removed by setting the value to NULL.

### Usage

```
BDMethod(x, i) <- value

## S4 replacement method for signature 'BDMethodList,character,BDMethod'
BDMethod(x, i) <- value

## S4 replacement method for signature 'BDMethodList,character,`NULL`'
BDMethod(x, i) <- value

## S4 replacement method for signature 'BenchDesign,character,BDMethod'
BDMethod(x, i) <- value

## S4 replacement method for signature 'BenchDesign,character,`NULL`'
BDMethod(x, i) <- value</pre>
```

# Arguments

```
x BenchDesign or BDMethodList object.
```

i character name of method.

value BDMethod or NULL.

14 BDMethodList

### Value

modified BenchDesign object

#### Author(s)

Patrick Kimes

#### See Also

**BDMethod** 

### **Examples**

```
bd <- BenchDesign()
BDMethod(bd, "avg") <- BDMethod(x = base::mean)
bd</pre>
```

BDMethodList

Create a new BDMethodList object

# Description

Initializes a new SimpleList of BenchDesign method (BDMethod) objects.

Similar to BDMethod objects, BDMethodList typically do not need to be directly constructed. Because the list of methods is only useful as art of a BenchDesign object, it is more common to simply manipulate the list of methods through calls to the corresponding BenchDesign, e.g. addMethod to add a new method to the list.

The constructor can also be used to access the BDMethodList list of methods in a BenchDesign object.

# Usage

```
BDMethodList(..., x = NULL)
## S4 method for signature 'ANY'
BDMethodList(..., x = NULL)
## S4 method for signature 'BenchDesign'
BDMethodList(..., x = NULL)
## S4 method for signature 'SummarizedBenchmark'
BDMethodList(..., x = NULL)
```

BDMethodList-class 15

# Arguments

```
a named list of BDMethod objectsa BenchDesign or SummarizedBenchmark object to extract the list of methods from. (default = NULL)
```

# Value

BDMethodList object

### Author(s)

Patrick Kimes

#### See Also

BDMethodList-class, BenchDesign, BDMethod

# **Examples**

BDMethodList-class

BDMethodList class

# **Description**

Extension of the SimpleList class to contain a list of BDMethod objects. The class serves as the primary container for the set of methods in the BenchDesign class.

New BDMethodList objects can be created using the BDMethodList constructor.

### Author(s)

Patrick Kimes

BDMethodList<-

# See Also

BDMethodList<-

Set method list in BenchDesign object

# Description

Replaces the BDMethodList list of methods in a BenchDesign object with a specified BDMethodList object.

# Usage

```
BDMethodList(x) <- value
## S4 replacement method for signature 'BenchDesign,BDMethodList'
BDMethodList(x) <- value</pre>
```

# **Arguments**

x BenchDesign object.

value BDMethodList list of methods.

#### Value

modified BenchDesign object

# Author(s)

Patrick Kimes

# See Also

BDMethod, BDMethodList

```
bd <- BenchDesign()
BDMethodList(bd) <- BDMethodList(avg = BDMethod(x = base::mean))
bd</pre>
```

BenchDesign 17

BenchDesign Create a new Ben	chDesign object

### Description

Initializes a new BenchDesign object of benchmarking methods and data.

The BenchDesign class serves as the core container for methods and data used for benchmarking in the SummarizedBenchmark package. The object can be initialized with a list of methods ot be benchmarked, a default benchmarking data set, both or neither. Methods must be passed to the constructor as BDMethod or BDMethodList objects.

The constructor can also be used to access the BenchDesign stored in a SummarizedBenchmark object.

### Usage

```
BenchDesign(..., methods = NULL, data = NULL)
## S4 method for signature 'ANY'
BenchDesign(..., methods = NULL, data = NULL)
## S4 method for signature 'SummarizedBenchmark'
BenchDesign(methods, data)
```

### Arguments

... named set of BDMethod objects and/or unnamed BenchDesign objects. Only the

methods of any BenchDesign object will be used, and the data slot of the objects

will be ignored.

methods named set of BDMethod objects and/or unnamed BenchDesign objects as a list.

(default = NULL)

data optional data.frame or other list object to be used in the benchmark. (default =

NULL)

# Value

BenchDesign object.

# Author(s)

Patrick Kimes

#### See Also

BenchDesign-class, BDMethod, BDMethodList

18 BenchDesign-class

### **Examples**

BenchDesign-class

BenchDesign class

### **Description**

Along with the SummarizedBenchmark class, one of the two main classses of the Summarized-Benchmark package. The BenchDesign class serves as a container for both the set of methods to be benchmarked and optionally the data to be used for benchmarking.

Methods are organized as BDMethod objects and stored in as a list using the BDMethodList class. The BDData class is used to store benchmarking data, or in some cases, just the MD5 hash of the original data set. Any list object, including data.frame objects, can be specified for data. More details on the component classes are provided in the corresponding class documentation.

For details on how to create new BenchDesign objects, see the documentation for the BenchDesign constructor.

#### **Slots**

data a list containing the data to be used in the benchmark.

methods a BDMethodList list of BDMethod objects to be compared in the benchmark.

### Author(s)

Patrick Kimes

#### See Also

BenchDesign, BDMethod-class, BDMethodList-class, BDData-class

buildBench 19

buildBench	Execute BenchDesign	

# Description

Function to evaluate methods defined in a BenchDesign on a supplied data set to generate a SummarizedBenchmark of benchmarking results. In addition to the results of applying each method on the data, the returned SummarizedBenchmark also includes metadata for the methods in the colData of the returned object, metadata for the data in the rowData, and session information in the metadata.

# Usage

```
buildBench(bd, data = NULL, truthCols = NULL, ftCols = NULL,
  sortIDs = FALSE, keepData = FALSE, catchErrors = TRUE,
  parallel = FALSE, BPPARAM = bpparam())
```

# **Arguments**

-8	
bd	BenchDesign object.
data	Data set to be used for benchmarking, will take priority over data set specified to BenchDesign object. Ignored if NULL. (default = NULL)
truthCols	Character vector of column names in data set corresponding to ground truth values for each assay. If specified, column will be added to the groundTruth DataFrame of the returned SummarizedBenchmark object. If the BenchDesign includes only a single assay, the same name will be used for the assay. If the BenchDesign includes multiple assays, to map data set columns with assays, the vector must have names corresponding to the assay names specified to the post parameter at each addMethod call. (default = NULL)
ftCols	Vector of character names of columns in data set that should be included as feature data (row data) in the returned SummarizedBenchmark object. (default = NULL)
sortIDs	Whether the output of each method should be merged and sorted using IDs. See Details for more information. (default = FALSE)
keepData	Whether to store the data as part of the BenchDesign slot of the returned SummarizedBenchmark object. If FALSE, a MD5 hash of the data will be stored with the BenchDesign slot. (default = FALSE)
catchErrors	logical whether errors produced by methods during evaluation should be caught and printed as a message without stopping the entire build process. (default = TRUE)
parallel	Whether to use parallelization for evaluating each method. Parallel execution is performed using <b>BiocParallel</b> . Parameters for parallelization should be specified with register or through the BPPARAM parameter. (default = FALSE)
BPPARAM	Optional BiocParallelParam instance to be used when parallel is TRUE. If not specified, the default instance from the parameter registry is used.

20 buildBench

#### **Details**

Parallelization is performed across methods. Therefore, there is currently no benefit to specifying more cores than the total number of methods in the BenchDesign object.

By default, errors thrown by individual methods in the BenchDesign are caught during evaluation and handled in a way that allows buildBench to continue running with the other methods. The error is printed as a message, and the corresponding column in the returned SummarizedBenchmark object is set to NA. Since many benchmarking experiments can be time and computationally intensive, having to rerun the entire analysis due to a single failed method can be frustrating. Default error catching was included to alleviate these frustrations. However, if this behavior is not desired, setting catchErrors = FALSE will turn off error handling.

If sortIDs = TRUE, each method must return a named vector or list. The names will be used to align the output of each method in the returned SummarizedBenchmark. Missing values from each method will be set to NA. This can be useful if the different methods return overlapping, but not identical, results. If truthCols is also specified, and sorting by IDs is necessary, rather than specifying sortIDs = TRUE, specify the string name of a column in the data to use to sort the method output to match the order of truthCols.

When a method specified in the BenchDesign does not have a postprocessing function specified to post =, the trivial base::identity function is used as the default postprocessing function.

#### Value

SummarizedBenchmark object.

compareBDData 21

compareBDData

Compare BDData objects

# Description

Simple comparison of two BDData objects based on comparing both type and data hash.

# Usage

```
compareBDData(x, y)
```

# **Arguments**

```
x a BDData or BenchDesign objecty a BDData or BenchDesign object
```

### Value

list of two values giving agreement of "data" and "type".

# Author(s)

Patrick Kimes

### See Also

compareBenchDesigns

```
## compare data with same MD5 hash value
bdd1 <- BDData(data.frame(x = 1:10))
bdd1h <- hashBDData(bdd1)
compareBDData(bdd1, bdd1h)

## compare different data, both same type
bdd2 <- BDData(data.frame(x = 2:11))
bdd2h <- hashBDData(bdd2)
compareBDData(bdd1, bdd2)
compareBDData(bdd1h, bdd2h)

## compare completely different data
compareBDData(bdd1, bdd2h)</pre>
```

compareBDMethod

Compare BDMethod objects

#### **Description**

Simple comparison of two BDMethod objects based on meta data.

### Usage

```
compareBDMethod(x, y)
```

### **Arguments**

```
x a BDMethod object
y a BDMethod object
```

#### Value

logical value indicating whether the two objects produced the same meta data.

### Author(s)

Patrick Kimes

#### See Also

```
compareBenchDesigns
```

### **Examples**

```
bdm1 <- BDMethod(stats::rnorm, params = rlang::quos(n = 100))
bdm2 <- BDMethod(stats::rt, params = rlang::quos(n = 100, df = 1))
compareBDMethod(bdm1, bdm2)</pre>
```

compareBenchDesigns

Compare BenchDesign objects

# Description

Comparison of BenchDesign objects and BenchDesign method information stored in Summarized-Benchmark objects. Inputs can be either BenchDesign or SummarizedBenchmark objects. If SummarizedBenchmark objects are specified, the method metadata stored in the colData will be used for the comparison. If only a single SummarizedBenchmark object is specified, the colData information will be compared with the BenchDesign object in the BenchDesign slot of the object. To compare the BenchDesign slots of SummarizedBenchmark objects, the BenchDesigns should be extracted with BenchDesign(sb) and passed as inputs (see Examples).

# Usage

### **Arguments**

```
x a SummarizedBenchmark or BenchDesign object
y an optional second SummarizedBenchmark or BenchDesign object (default = NULL)
... other parameters
```

### Value

list of comparison results

### Author(s)

Patrick Kimes

### See Also

compareBDMethod, compareBDData

24 dropMethod

dropMethod

Remove method from BenchDesign object

### **Description**

Takes a BenchDesign object and the name of an existing method and returns a reduced BenchDesign object with the method removed.

# Usage

```
dropMethod(bd, label)
```

### **Arguments**

bd BenchDesign object.

label Character name of method.

# Value

Modified BenchDesign object with specified method dropped.

# Author(s)

Patrick Kimes

### See Also

modifyMethod, expandMethod, addMethod

```
## remove methods
bench <- dropMethod(bench, label = "bonf")
BDMethodList(bench)</pre>
```

estimateMetricsForAssay

Estimate performance metrics in SummarizedBenchmark object

# Description

These functions estimate the performance metrics, either passed as arguments or added previously with the addPerformanceMetric function. The function will estimate the performance metric for each method.

# Usage

```
estimateMetricsForAssay(object, assay, evalMetric = NULL,
   addColData = FALSE, evalFunction = NULL, tidy = FALSE, ...)

estimatePerformanceMetrics(object, addColData = FALSE, tidy = FALSE,
   rerun = TRUE, ...)
```

# Arguments

ect	A SummarizedBenchmark object.
ay	A string with an assay name. Indicates the assay that should be given as input to this performance metric.
lMetric	A string with the name of the evaluation metric.
ColData	Logical (default: FALSE). If TRUE, the results are added to the colData slot of the SummarizedExperiment object and the object is returned. If FALSE, only a DataFrame with the results is returned.
lFunction	A function that calculates a performance metric. It should contain at least two arguments, query and truth, where query is the output vector of a method and truth is the vector of ground true values. If additional parameters are specified, they must contain default values. If this parameter is passed, the metrics in the object are ignored and only this evaluation metric is estimated.
у	Logical (default: FALSE). If TRUE, a long formated data.frame is returned.
	Additional parameters passed to the performance functions.
un	Logical (default: TRUE). By default, all performance metrics are recalculated everytime that <code>estimatePerformanceMetrics</code> is called. If FALSE, performance metrics will only be calculated for newly added methods or modified methods.
	ay lMetric ColData lFunction

26 expandMethod

#### Value

Either a SummarizedBenchmark object, a DataFrame or a data.frame.

#### **Functions**

- estimateMetricsForAssay: Estimate performance metrics for a given assay
- estimatePerformanceMetrics: Estimate performance metrics for all assays

### Author(s)

Alejandro Reyes

#### See Also

availableMetrics, performanceMetrics

# **Examples**

```
data( sb )
sb <- addPerformanceMetric(
  object=sb,
    assay="qvalue",
  evalMetric="TPR",
  evalFunction = function( query, truth, alpha=0.1 ){
      goodHits <- sum( (query < alpha) & truth == 1 )
      goodHits / sum(truth == 1)
  }
)

qvalueMetrics <- estimateMetricsForAssay( sb, assay="qvalue" )
allMetrics <- estimatePerformanceMetrics( sb )
allMetricsTidy <- estimatePerformanceMetrics( sb, tidy=TRUE )</pre>
```

expandMethod

Expand method in BenchDesign object

### **Description**

Takes a BenchDesign object, the name of an existing method, and new parameter specifications, and returns a modified BenchDesign object with new methods added. The named method is "expanded" to mutliple methods according to the specified set of parameters.

### Usage

```
expandMethod(bd, label, params, onlyone = NULL, .replace = FALSE,
   .overwrite = FALSE)
```

expandMethod 27

#### **Arguments**

bd BenchDesign object.

label Character name of method to be expanded.

params Named list of quosure lists specifying the label of the new methods to be added

to the BenchDesign, and the set of parameters to overwrite in the original method definition for each new method. Alternatively, if onlyone is non-NULL, a single quosure list with name = value pairs specifying the label of the new methods and the values to use for overwriting the parameter specified in onlyone.

onlyone Character name of a parameter to be modified. Only specify if just a single

parameter should be replaced in the original method definition. Ignored if NULL.

(default = NULL)

. replace Logical whether original label method should be removed. (default = FALSE)
. overwrite Logical whether to overwrite the existing list of parameters (TRUE) or to simply

add the new parameters to the existing list (FALSE). (default = FALSE)

### Value

Modified BenchDesign object with new methods with specified parameters added.

### Author(s)

Patrick Kimes

28 groundTruths<-

groundTruths

Get ground truths in SummarizedBenchmark object

### **Description**

Method to get groundTruths in SummarizedBenchmark object.

# Usage

```
groundTruths(object, ...)
## S4 method for signature 'SummarizedBenchmark'
groundTruths(object, ...)
```

### **Arguments**

object a SummarizedBenchmark object.

. . . further arguments, perhaps used by methods.

### Value

modified BenchDesign object

# Author(s)

Alejandro Reyes

groundTruths<-

Set ground truths in SummarizedBenchmark object

### **Description**

Method to set groundTruths in SummarizedBenchmark object.

### Usage

```
groundTruths(object, ...) <- value
## S4 replacement method for signature 'SummarizedBenchmark'
groundTruths(object, ...) <- value</pre>
```

### **Arguments**

object a SummarizedBenchmark object.

... futher arguments, perhaps used by methods.

value replacement set of ground truths.

hashBDData 29

# Value

modified BenchDesign object

### Author(s)

Alejandro Reyes, Patrick Kimes

hashBDData

Hash data in BDData object

# **Description**

Repliaces data stored in a BDData object with the MD5 hash of the data. If the data was already a MD5 hash, the original object is returned unchanged. The method can be called directly on BenchDesign objects to hash the underlying data as well.

# Usage

```
hashBDData(object)
## S4 method for signature 'BDData'
hashBDData(object)
## S4 method for signature 'BenchDesign'
hashBDData(object)
```

# Arguments

object

a BDData or BenchDesign object

### Value

an object of the same class as object with data converted to a MD5 hash.

### Author(s)

Patrick Kimes

30 modifyMethod

```
{\tt mcols}{<{	extstyle -}} , {\tt SummarizedBenchmark-method}
```

Set meta data columns in SummarizedBenchmark object

# **Description**

Modifies the mcols slot of a SummarizedBenchmark object.

# Usage

```
## S4 replacement method for signature 'SummarizedBenchmark' mcols(x, ...) \leftarrow value
```

# **Arguments**

x A SummarizedBenchmark object.

... Futher arguments, perhaps used by methods.

value A DataFrame of meta data.

### Value

Modfied SummarizedBenchmark object.

# Author(s)

Alejandro Reyes

### See Also

SummarizedBenchmark

 ${\tt modifyMethod}$ 

Modify method in BenchDesign object

# Description

Takes a BenchDesign object, the name of an existing method, and new parameter specifications, and returns a modified BenchDesign object with the specified changes.

# Usage

```
modifyMethod(bd, label, params, .overwrite = FALSE)
```

modifyMethod 31

# **Arguments**

bd BenchDesign object.

label Character name of method to be modified.

params Named quosure list created using quos of parameter = value paiars to replace

in the method definition. The post, and meta parameters of the method can be modified using the special keywords, bd.post, and bd.meta (the prefix denoting that these values should modify BenchDesign parameters). All other named

parameters will be added to the list of parameters to be passed to func.

.overwrite Logical whether to overwrite the complete existing list of parameters to be

passed to func (TRUE), or to simply add the new parameters to the existing list

and only replace overlapping parameters (FALSE). (default = FALSE)

#### Value

Modified BenchDesign object with single method parameters modified.

32 performanceMetrics

performanceMetrics

Get performance metrics in SummarizedBenchmark object

# **Description**

Given a SummarizedBenchmark object, returns a list of lists of performance metrics that have been defined for each assay. Optionally, if assay = is specified, performance metrics for only the specified subset of specified assays are returned.

# Usage

```
performanceMetrics(object, ...)
## S4 method for signature 'SummarizedBenchmark'
performanceMetrics(object, assay = NULL)
```

# **Arguments**

object a SummarizedBenchmark object.

... futher arguments, perhaps used by methods. assay a character string indicating an assay name.

### Value

A SimpleList with one element for each assay. Each element of the list contains a list of performance metric functions.

### Author(s)

Alejandro Reyes

### See Also

 ${\tt addPerformanceMetric}, estimate {\tt PerformanceMetrics}$ 

```
data(sb)
performanceMetrics(sb)
performanceMetrics(sb, assay = "qvalue")
```

performanceMetrics<- 33

```
performanceMetrics<- Set performance metrics in SummarizedBenchmark object
```

# Description

Replaces the list of performance metrics in a SummarizedBenchmark object with a new list of performance metric lists.

# Usage

```
performanceMetrics(object, ...) <- value

## S4 replacement method for signature 'SummarizedBenchmark,SimpleList'
performanceMetrics(object) <- value</pre>
```

# **Arguments**

```
object a SummarizedBenchmark object.
... futher arguments, perhaps used by methods.
value a SimpleList of the same length as the number of assays.
```

### Value

Silently, the newly specified SimpleList of performance metric lists.

### Author(s)

Alejandro Reyes

### See Also

addPerformanceMetric, estimatePerformanceMetrics, performanceMetrics

```
data(sb)
performanceMetrics(sb)
performanceMetrics(sb) <- SimpleList(qvalue = list(), logFC = list())</pre>
```

34 plotMethodsOverlap

plotMethodsOverlap

Plot UpSetR for SummarizedBenchmark object

# Description

This function looks for an assay, called by default 'qvalue', and given an alpha threshold, it binarizes the assay matrix depending on whether its values are below the alpha threshold. Then it uses the function upset to plot the overlaps. The plot is only generated if at least 2 methods have observations that pass the alpha threshold.

# Usage

```
plotMethodsOverlap(object, assay = "qvalue", alpha = 0.1, ...)
```

# **Arguments**

object A SummarizedBenchmark object.

assay The name of an assay.

alpha An alpha value.

... Further arguments passed to upset

# Value

An upseR plot.

# Author(s)

Alejandro Reyes

### See Also

plotROC, estimatePerformanceMetrics

```
data(sb)
## Not run:
plotMethodsOverlap(sb)
## End(Not run)
```

plotROC 35

plotROC

Plot ROC curve for SummarizedBenchmark object

# Description

This function inputs a SummarizedBenchmark object, looks for an assay called 'qvalue' and plots receiver operating characteristic curves for each of the methods to benchmark.

# Usage

```
plotROC(object, assay = "qvalue")
```

# Arguments

object A SummarizedBenchmark object.

assay An assay name.

#### Value

A ggplot object.

# Author(s)

Alejandro Reyes

# See Also

plotMethodsOverlap, estimatePerformanceMetrics

```
data(sb)
## Not run:
plotROC(sb)
## End(Not run)
```

36 printMethod

printMethod

Pretty print methods in a BenchDesign object

### **Description**

Print out details about a method included in the BenchDesign. The printMethods function is just a wrapper to call printMethod on all methods in the BenchDesign.

### Usage

```
printMethod(bd, n = NULL)
printMethods(bd)
```

# Arguments

bd BenchDesign object.

n name of a method in the BenchDesign to show.

### Value

Brief description is returned to console.

### Author(s)

Patrick Kimes

# See Also

SummarizedBenchmark

Create a new SummarizedBenchmark object

### **Description**

Function to construct SummarizedBenchmark objects.

### Usage

```
SummarizedBenchmark(assays, colData, ftData = NULL, groundTruth = NULL,
    performanceMetrics = NULL, BenchDesign = NULL, ...)
```

### **Arguments**

assays A list containing outputs of the methods to be benchmark. Each element of the

list must contain a matrix or data.frame of n x m, n being the number of features tested (e.g. genes) and m being the number of methods in the benchmark. Each element of the list must contain a single assay (the outputs of the methods). For example, for a benchmark of differential expression methods, one assay could contain the q-values from the different methods and another assay could be the estimated log fold changes.

colData A Da

A DataFrame describing the annotation of the methods. These could include

version of the software or the parameters used to run them.

40 SummarizedBenchmark

ftData A DataFrame object describing the rows. This parameter is equivalent to the

parameter rowData of a SummarizedExperiment.

groundTruth If present, a DataFrame containing the ground truths. If provided, the number

of columns must be the same as the number of assays (NA's are accepted). The

names of the columns should have the same names as the assays.

performanceMetrics

A SimpleList of the same length as the number of assays. Each element of the list must be a list of functions. Each function must contain the parameters

'query' and 'truth'.

BenchDesign A BenchDesign containing the code used to construct the object. (default =

NULL)

... Additional parameters passed to SummarizedExperiment.

#### Value

A SummarizedBenchmark object.

### Author(s)

Alejandro Reyes

```
## loading the example data from iCOBRA
library(iCOBRA)
data(cobradata_example)
## a bit of data wrangling and reformatting
assays <- list(
    qvalue=cobradata_example@padj,
    logFC=cobradata_example@score )
assays[["qvalue"]]$DESeq2 <- p.adjust(cobradata_example@pval$DESeq2, method="BH")
groundTruth <- DataFrame( cobradata_example@truth[,c("status", "logFC")] )</pre>
colnames(groundTruth) <- names( assays )</pre>
colData <- DataFrame( method=colnames(assays[[1]]) )</pre>
groundTruth <- groundTruth[rownames(assays[[1]]),]</pre>
## constructing a SummarizedBenchmark object
sb <- SummarizedBenchmark(</pre>
    assays=assays, colData=colData,
    groundTruth=groundTruth )
colData(sb)$label <- rownames(colData(sb))</pre>
```

SummarizedBenchmark-class

SummarizedBenchmark class

# **Description**

Extension of the RangedSummarizedExperiment to store the output of different methods intended for the same purpose in a given dataset. For example, a differential expression analysis could be done using **limma**-voom, **edgeR** and **DESeq2**. The SummarizedBenchmark class provides a framework that is useful to store, benckmark and compare results.

#### **Slots**

performanceMetrics A SimpleList of the same length as the number of assays containing performance functions to be compared with the ground truths.

BenchDesign A BenchDesign originally used to generate the results in the object.

### Author(s)

Alejandro Reyes

```
## loading the example data from iCOBRA

```

42 tidyBDMethod

tdat

Example data.frame containing results for 50 two-sample t-tests.

### **Description**

Example data.frame containing results for 50 two-sample t-tests.

#### Format

a data.frame that contains the results of 50 simulated two-sample t-tests, with each row corresponding to an independent test. The data.frame includes the following 5 columns: 1. H = binary 0/1 whether data for the test was simulated under the null (0) or alternative (1) 2. test\_statistic = test-statistics of the t-test 3. effect\_size = mean difference between the two sample groups 4. pval = p-value of the t-test 5. SE = standard error of the t-test

# **Examples**

```
data(tdat)
```

tidyBDMethod

Tidy BDMethod Data

### **Description**

A helper function to extract information for a single or multiple BDMethod object or a list of BDMethod objects.

# Usage

```
tidyBDMethod(obj, dat = NULL, eval = FALSE, label = FALSE)

## S4 method for signature 'BDMethod'
tidyBDMethod(obj, dat, eval)

## S4 method for signature 'list'
tidyBDMethod(obj, dat = NULL, eval = FALSE,
    label = FALSE)

## S4 method for signature 'SimpleList'
tidyBDMethod(obj, dat = NULL, eval = FALSE,
    label = FALSE)

## S4 method for signature 'BenchDesign'
tidyBDMethod(obj, dat = NULL, eval = FALSE,
    label = FALSE)
```

tidyUpMetrics 43

### **Arguments**

obj	BDMethod object, list/List of BDMethod objects (e.g. a BDMethodList), or a BenchDesign object
dat	optional data object to use when evaluating any unevaluated expressions in bdm meta data. (default = NULL)
eval	logical whether to evaluate any quosures in the meta slot of the BDMethod objects. (default = FALSE)
label	logical whether to add a "label" column to the resulting table containing the names of the methods if obj was specified as a named list. (default = FALSE)

#### **Details**

If any quosures are specified to the "meta" slot of a BDMethod object, the quosure is converted to a text string using rlang::quo\_text.

# Value

A named vector of meta data if only a single BDMethod object specified, else a tibble of meta data for the specified list of methods.

# Author(s)

Patrick Kimes

tidyUpMetrics	Tidy up performance metrics in SummarizedBenchmark object	

# Description

This function takes as input a SummarizedBenchmark object, extracts the estimated performance metrics and reformats them into a long-formated data frame.

# Usage

```
tidyUpMetrics(object)
```

# Arguments

object A SummarizedBenchmark object.

#### Value

A tidy data.frame

# Author(s)

Alejandro Reyes

44 updateBench

### See Also

```
estimatePerformanceMetrics
```

#### **Examples**

updateBench

Check/Update SummarizedBenchmark

### **Description**

Function to update or check status of SummarizedBenchmark results.

If only a SummarizedBenchmark object is specified, the function will check whether 'func', 'param', 'meta', 'post' or the 'pkg\_vers' of the methods in the BenchDesign stored with the SummarizedBenchmark do not match values stored in the colData. By default, no methods will be executed to update results. To actually execute updates, set dryrun = FALSE.

If a BenchDesign object is specified in addition to a SummarizedBenchmark object, the function will check which methods in the new BenchDesign need to be executed to update the SummarizedBenchmark results. Again, by default, no methods will be executed unless dryrun = FLASE is specified.

Unless reuseParams = FALSE is specified, the parameters of the last execution session stored in the the colData of the SummarizedBenchmark object will be used.

### Usage

```
updateBench(sb, bd = NULL, dryrun = TRUE, version = FALSE,
  keepAll = TRUE, reuseParams = TRUE, ...)
```

### Arguments

sb	a SummarizedBenchmark object
bd	a BenchDesign object
dryrun	logical whether to just print description of what would be updated rather than actually running any methods. (default = TRUE)
version	logical whether to re-run methods with only package version differences. (default = $FALSE$ )
keepAll	logical whether to keep methods run in original SummarizedBenchmark but not in new BenchDesign. Only used if bd is not NULL. (default = TRUE)

updateBench 45

reuseParams logical whether to reuse parameters from buildBench call used to create SummarizedBenchmark

object (if available). Directly specified buildBench parameters still take prece-

dence. (default = TRUE)

... optional parameters to pass to buildBench.

### Value

SumamrizedBenchmark object.
